

CENTER FOR Clinical Research

Innovative research **today**
creates a positive domino effect on
countless people **tomorrow.**

The Center for Clinical Research is dedicated to conducting clinical trials in a safe and professional manner to contribute to the discovery of new treatments in all areas of medicine. We are focused on rural outreach to offer cutting-edge care to diverse populations in Kansas and to expand access to these treatments throughout the region. The discoveries and the processes are pivotal moments for faculty development and core student learning in pharmacology. They provide extensive resources for community health care partners; and, consequently, solutions for patients providing new, tested and approved medications and treatments. These research trials give us and others the tools to improve future research for the betterment of humanity.

OUR CENTER

Studies

- Topics for studies have ranged from pediatric depression to Alzheimer's and diabetes to Crohn's disease.
- The length of a study can range from eight weeks to multiple years.
- Two to three new studies are started per year.

Study participation

- Individuals who participate in medication trials not only receive potentially new beneficial medication, but their experiences also help provide useful information for the field and to advance medicine and science.
- Individuals who participate in research trials are helping the process of creating new knowledge for future patients.
- By conducting research studies with a variety of populations from children to adults, we have been able to develop a timeline study for people with type 1 diabetes and help prove the beneficial effects of a medication for mild dementia due to Alzheimer's disease.
